An aqueous solution is an element dissolved in a liquid, usually H₂O. A non-aqueous solution is either a liquid (pure substance, non electrolyte) or a gas. These terms are most commonly found in ...Nonelectrolytes are compounds that do not ionize at all in solution. As a result, solutions containing nonelectrolytes will not conduct electricity. Typically, nonelectrolytes are primarily held together by covalent rather than ionic bonds. A common example of a nonelectrolyte is glucose, or C₆H₁₂O₆.Phase Diagram for an Aqueous Solution of a Nonelectrolyte The colligative effects on vapor pressure, boiling point, and freezing point described in the previous section are conveniently summarized by comparing the phase diagrams for a pure liquid and a solution derived from that liquid.A nonelectrolyte is a substance that does not exist in an ionic form in aqueous solution. Nonelectrolytes tend to be poor electrical conductors and don't readily dissociate into ions when melted or dissolved. Solutions of nonelectrolytes do not conduct electricity., Aqueous Solution Of A Nonelectrolyte.
